

Meet us at
booth 50017

Every year , 360 million tons of merchandise and 30 percent of vaccines are lost throughout the world due to a cold chain failure (IRSTEA 2014).

Because we all have the responsibility of looking after and protecting our assets, Sensineo has developed SAM in order **to maintain the cold chain integrity**, in line with the traceability standards.

SAM allows you **to intervene upstream** and to **do more than just acknowledge** the cold chain failure.

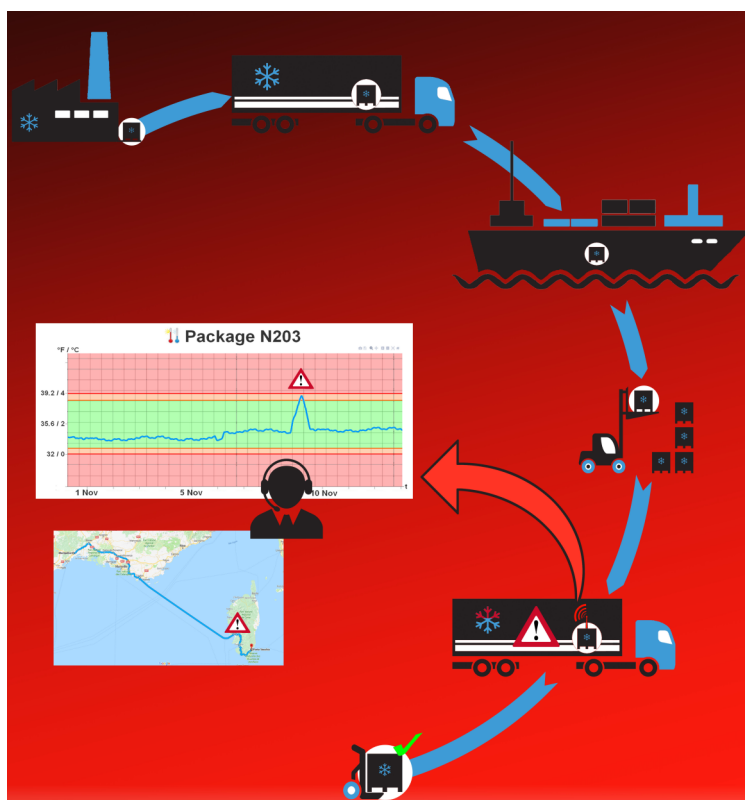

SAM benefits from recent innovative technology in artificial intelligence, connectivity and energy transformation.

Thanks to micro cells on the case, SAM transforms ambient light into energy which it uses to charge its own battery. SAM is therefore **100% autonomous**.

The dashboard enables one to set thresholds and zones. Once these intervals are surpassed SAM generates a **real time notification alarm**. It is therefore easy to **intervene prior** to a serious problem caused by a failure in the cold chain by **tracking the connected tag**. It can be retrieved online on a smartphone or a laptop at anytime.

Thanks to its **small size**, new technology, **international coverage with no roaming fees** and a discard of **unhealthy electromagnetic waves** for humans animals or products, SAM is the ideal candidate to ensure protection in a wide range of industries and applications scopes.
